

## SLR Alluvial Plain Wells (/initiative/4Xxk/slr-alluvial-plain-wells)

The desal dEIR says that Carollo Engineers in about 2001 reported well opportunities in the San Lorenzo River (SLR) alluvial plane, yielding up to some 800 AFY...some of it was brackish. Much of the remainder was not available year-around, but could still help cool water in the hot, polluted SLR alluvial lagoon, pumping alluvial wellwater from Tait Street to Felton in either a water-looping scheme (<https://civonomics.com/initiative/4XwT/water-looping>) or in a simple effort to stimulate and support fish migration by increasing the flow from Felton to the sea.
