

Off-Stream Storage Reservoir (Booth 18) (/initiative/4Wcr/off-stream-storage-reservoir-booth-18)

I recommend constructing an off-stream storage reservoir on one of the six reservoir sites that I have studied. Water would be pumped from the San Lorenzo River and coastal streams during winter runoff periods when excess water is flowing into the ocean. This water would be supplied to the city's water treatment plant during winter storms when the river water is too turbid to be processed at the treatment plant. This will allow water to be pumped from the Felton Diversion to Lock Lomond. This water could be used to supplement summer flows in the river, providing for fish runs.

An old quarry doesn't have the fish habitat concerns of Zayante. The connections to our existing water system are well reasoned.
